

BTS Strategic Asset Allocation Program

Alpha Moderate at Trust Company of America

Analysis Period: Start: October 1, 2001

End: December 31, 2007

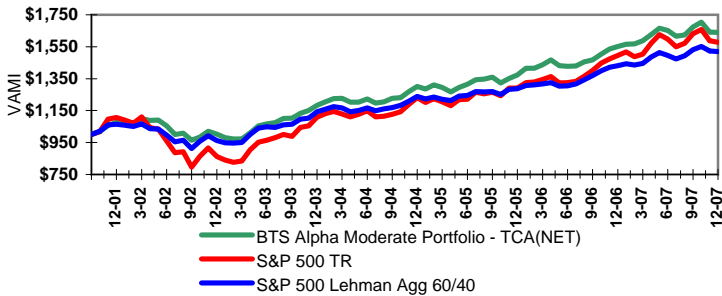

Benchmark 1: S&P 500 TR
Portfolio Weighted Avg Internal Expense: 0.66

Benchmark 2: S&P 500 Lehman Agg 60/40

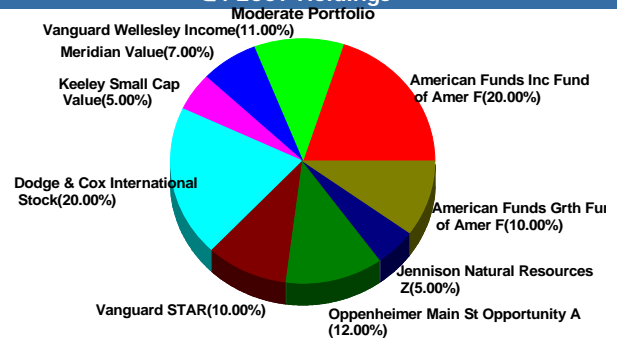

Portfolio Description*

The Alpha Moderate Portfolio is for the investor willing to accept more risk than the conservative investor, but still not willing to accept the short-term downside risk associated with portfolios seeking dramatic gains. BTS will select funds we believe meet this criteria. The appropriate time horizon for this investment is five years or more. The Moderate benchmark is 60% of the S&P 500 and 40% of the Lehman Aggregate Bond Index, rebalanced quarterly. You should consider carefully the Alpha Moderate Portfolio's investment goals and horizons, risks, charges and expenses before investing. Carefully review the mutual fund prospectuses where you will find this and other important information. Please call your financial representative to obtain fund prospectuses. Returns are shown net of a 2% maximum annual fee charged quarterly, in advance.

Value Added Monthly Index (Growth of \$1,000)*

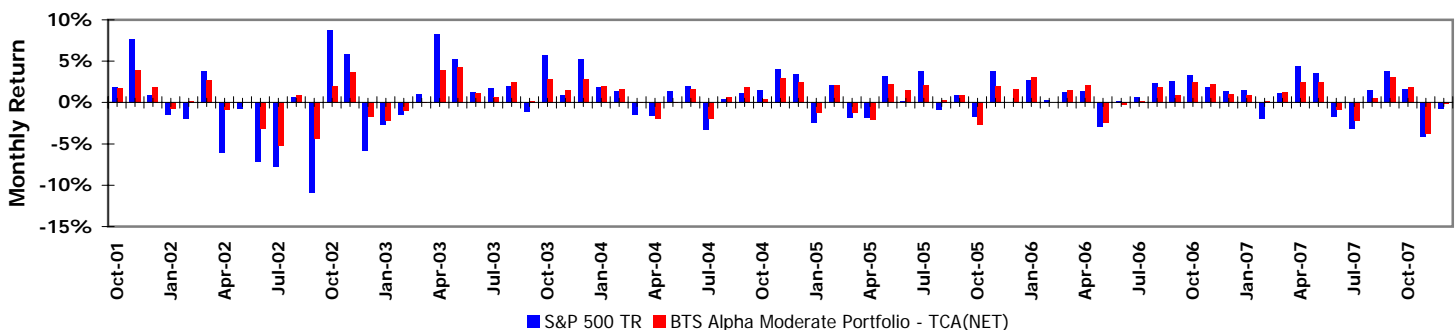

Q4 2007 Holdings

THIS MATERIAL IS NOT AN OFFER OF FUND SHARES

The BTS Strategic Portfolios show quarterly rebalancing to previously determined allocation percentages. Asset allocation recommendations are likely to change. It should not be assumed that investment decisions made in the future will be profitable or will equal the performance shown above. The above illustration reflects a generally rising securities market. Performance does not reflect the possible effects of custodial and transaction fees. Results are based on the reinvestment of dividends and capital gains. 2001 returns are for partial year only, beginning October 1, 2001 and ending December 31, 2001.

The S&P 500 includes 500 leading companies in leading industries of the U.S. economy and is a proxy for the total stock market.

The Lehman Aggregate Bond Index is comprised of government securities, mortgage-backed securities, asset-backed securities and corporate securities with maturities of one year or more to simulate the universe of bonds in the market.

VAMI reflects the growth of a hypothetical \$1,000 in a given investment over time. The value is equal to \$1,000 at inception. Subsequent month-end values are calculated by multiplying the previous month's VAMI index by 1 plus the current month rate of return.

Standard Deviation measures the degree of variation of returns around the average return; the higher the volatility, the higher the standard deviation.

Sharpe Ratio is a risk-adjusted performance measure (the incremental average return over the risk-free rate - represented as 5% - divided by risk), where risk is defined by standard deviation.

Sortino Ratio is a risk-adjusted performance measure (the incremental average return over the minimum acceptable return - represented as 5% - divided by risk), where risk is defined by downside deviation.

Downside Deviation considers returns that fall below the minimum acceptable return.

Maximum Drawdown is the largest percentage drawdown that the investment has experienced.

Alpha measures a manager's value-added return over a benchmark index by comparing its actual return to the return expected based on the risk level.

Beta measures sensitivity to market movements relative to a benchmark index.

Correlation and *R-Squared* (Correlation Coefficient) measure how two securities move in relation to one another.
